SUMMARY

Fullstack software engineer who loves solving challenging problems and shipping products.

WORK EXPERIENCE

Staff Software Engineer, Equinix, Singapore

Jan 2021 - Present

Building the Customer Resource Hierarchy (CRH) experience at Equinix. CRH is like Google Cloud Platform's resource hierarchy in that it allows our customers to group their digital and colocation assets under organizations and projects, as well as allowing them to grant IAM roles to their users and attaching policies to their assets.

1. Building performant async APIs for CRH with high user scalability and reliability. Since the CRH APIs are invoked immediately after user auth, maintaining 5 nines availability and response time SLA is critical.
2. Building microfrontends, component library using React & Lit. Liasing with UX team and reviewing Figma designs.
3. Built modular & reusable CI/CD pipelines by leveraging GitHub composite actions.
4. Mentoring newer engineers and code review.

Software Developer, Uppsala Security, Singapore

May 2019 - Dec 2020

Uppsala Security is a startup building solutions to save users from fraudulent/scam transactions in the crypto world.

1. Built the Crypto Analysis Transaction Visualization (CATV) product. CATV visually illustrates the flow of crypto tokens to or from a wallet address, helping identify any interactions with suspicious addresses using a crowdsourced threat database.
2. Built search feature for threat indicators on top of Elasticsearch. This made user searches for any of the 50Mi+ indicators 6x faster than the existing relational search solution.

Software Developer, National University of Singapore, Singapore

Dec 2017 - May 2019

Credit Research Initiative (CRI) at NUS is a non-profit undertaking offering credit ratings for exchange-listed firms around the world.

1. Redesigned CRI's flagship product - a probability of default stress testing toolkit for corporate firms. The existing product was a MATLAB app packaged and distributed to corporate users resulting in undesirably sharing code with them. I designed the REST API to interface with the statistical models and built the frontend for users to interact with the toolkit, alongwith CI/CD setup and deployment on AWS.

Application Developer, IBM, Kolkata, India

Sep 2014 - Nov 2017

1. Built web apps for IBM's FMCG client on the Microsoft tech stack.
2. Worked on building data pipelines and OLAP cubes for analytics on inventory, factory capacity and output across regions.

EDUCATION

University of Illinois, Urbana-Champaign - Masters, Computer Science - GPA: 3.87/4

Aug 2022 - Dec 2024

PROJECTS

Simple HTTP Server, [Link](#)

- HTTP server that's capable of handling simple GET/POST requests, serving files and handling multiple concurrent connections.

SKILLS

Programming Languages : Java, Python, JavaScript, SQL
Frameworks & Libraries : Spring, Django REST framework, React, Lit, Express.js
Databases : PostgreSQL, MySQL
CI/CD & Orchestration : GHA, Docker, Kubernetes, Rancher
Observability : Honeycomb, Splunk, Jaeger, Appdynamics, Grafana

VOLUNTEERING

Developer Volunteer, stopthespread.info, Remote

Mar 2020 — Apr 2020

stopthespread was dedicated to gathering accurate and easy to understand factual information/guidelines in face of the growing COVID-19 pandemic crisis. I contributed to building features and content for the Australian site of stopthespread.
